turning the art of trading into a science™

INVESTIGATOR™ 2.0

the success formula

The old model of technical analysis is obsolete.
Time is at a premium and data on thousands of financial
instruments is inexpensively and readily available.
Trying to manually review a relatively small number
of charts dramatically limits your potential profits.

**Investigator is proud to introduce the alternative...**

1 create bar patterns visually

Some technical analysis programs claim to have quick and user friendly editors to create new bar patterns.
Have you ever tried to program or understand the following "English-like" statements?

(L-HY1) I2   %LO1 IF LOW {-1} > HIGH {-2}
(LY2-HY1) I2   THEN 1 ELSE 0

For those who prefer to spend their time on profitable trading, not computer programming,
Investigator offers a revolutionary new tool that allows you to design bar patterns visually.

1 Drag the significant open, high, low, and close for each of the bars into
the positions you desire. (You have the flexibility to add up to 20 bars to your pattern!)

2 Click the Add Condition or Add Percent Condition button.
The only typing required is when you want to enter a percent value!

3 Your pattern's conditions are generated automatically in English (not English-like statements)

"I made $18,000 in two days on one trade using a bar pattern that I quickly created, tested
historically, and then had Investigator search for on my end-of-day data."
L.H.   Dallas, Texas

"Finally a company has developed a tool to integrate industry standard indicators
using the ease of use of today's graphical user interface. I learned how to create and
test any trading system I wanted to in less than a minute."
Donald Robertson, Jr.
Individual Investor

2 new concept - delta relative strength

Since you read *Investor's Business Daily*, you're familiar with the concept of Relative Strength. Only Investigator allows you to
generate Relative Strength values for your own data, whether it be stocks, commodities, or any other financial instruments.
And Investigator allows you to view a list of your instruments sorted by their Relative Strength ranking.

Investigator extends the concept of Relative Strength with a new tool: Delta Relative Strength. This proprietary tool identifies
financial instruments that are moving up or down the Relative Strength lists, keeping you steps ahead of other investors.
For example,

PAST FOUR RELATIVE STRENGTH VALUES

90 90 90 90 <-- Note the strong but static Relative Strength values
50 60 70 80 <-- Delta Relative Strength captures the momentum shift

Delta Relative Strength identifies future potential market leaders. Relative Strength alone may overlook these momentum shifts,
since the instruments may get lost in the Relative Strength rankings.

3 new indicator - gann trend

Eliminate the guesswork of drawing trend lines by hand. The Gann Trend Indicator automatically
identifies the trend of a financial instrument (up, down, or none) and is a powerful stop-loss technique,
using the market's own price action to let you lock in profits.

Amazingly, some technical analysis programs charge thousand of dollars for a similar indicator.
This indicator alone makes Investigator a tremendous value.

1 Immediate trend identification

2 Immediate stop information, regardless of whether you're long or short!

3 Notice how the stops rise with the market, locking in your profits.

Mark Boucher, interviewed in April 1996's Technical Analysis of Stocks and Commodities,
calls the Gann Trend Indicator "one of the best trailing stop techniques that I have ever seen."

5 trading system validation

"Those who ignore the past are destined to suffer its consequences anew."
Investigator provides the means to heed this axiom by providing a fast and simple
method to evaluate the historical results for any system you create.
The valuable statistical information we report assures that
you understand the performance of each pattern:

* Overall statistical summary of all of the discovered trades.
* Trade by trade statistical analysis of each trade in a list format.
* Visual information using Investigator's TradeWindow™, which
allows you to view trades sequentially with the exact entry and exit bars pinpointed.

Not satisfied with this pattern's results? It's easy to modify and re-test the pattern
with a few clicks of your mouse. Once you've discovered a profitable pattern,
you can add it to your pattern library for automatic end-of-day testing.

4 easily incorporate industry indicators

Our easy-to-use testing dialog boxes allow you to incorporate the full range of industry standard
indicators into trading systems with simple point-and-click techniques. Want to historically test or
find on your end-of-day data the financial instruments that have just made new highs or double tops?
We make it simple.

Each indicator includes numerous default values to save you time and is fully explained in
our extensive on-line help. No black boxes here!

6 automate trading

You've seen how our visual bar pattern designer,
exclusive tools and indicators, and historical system
testing allow you to build a profitable pattern library.
The reward for your efforts? Automatic daily notification
of profitable trades, as indicated by your high confidence
patterns. Simply download quotes and review
Investigator's trade list, which notifies you as to
which trades you should be entering, which stops
you should be moving, and which
positions you should be exiting.

7 increased speed

Investigator's fast 32-bit program was developed exclusively for
Windows 95 and NT 4.0. It is optimized to analyze huge
volumes of data in minutes! Furthermore, testing runs
in the background, freeing your computer for other tasks.
You can even pause testing or view intermediate
results while testing continues.
